

# Functional lift of a headwater stream-wetland complex restoration revealed by a decade of environmental and ecological monitoring

National Stream Restoration Conference 2023

Jesse Robinson, P.E.<sup>1</sup> (Presenter), Michael Croasdaile, Ph. D<sup>1</sup>, Art Parola, Ph. D, P.E.<sup>1</sup>, Amy Braccia, Ph. D<sup>2</sup>, Jamie Lau, Ph. D<sup>3</sup>, Emily Jones<sup>2</sup>

<sup>1</sup> University of Louisville Stream Institute

<sup>2</sup> Eastern Kentucky University

<sup>3</sup> Radford University

# Outline

- Pre-Restoration Condition
- Restoration of the Valley
- Ecological Response
- Conclusions

Slabcamp Creek (Restored)

Whitepine Creek (Un-restored)

Licking River

5 km

### Study Area

- Streams
- Study Site Watersheds
- Licking River Subwatershed

# Pre-Restoration Condition

*Pre-restoration condition in 1950s. Homestead areas in purple*

*Ten years post restoration*

# Restoration of the Valley: Goals

- Reconnection of the historic valley aquifer
- Creating interconnected and diverse habitat
- Re-establish a frequent flooding regime
- Reduce flood velocities to retain habitat and organic matter

*RESULT: stream wetland complex*

*Pre-restoration Condition*

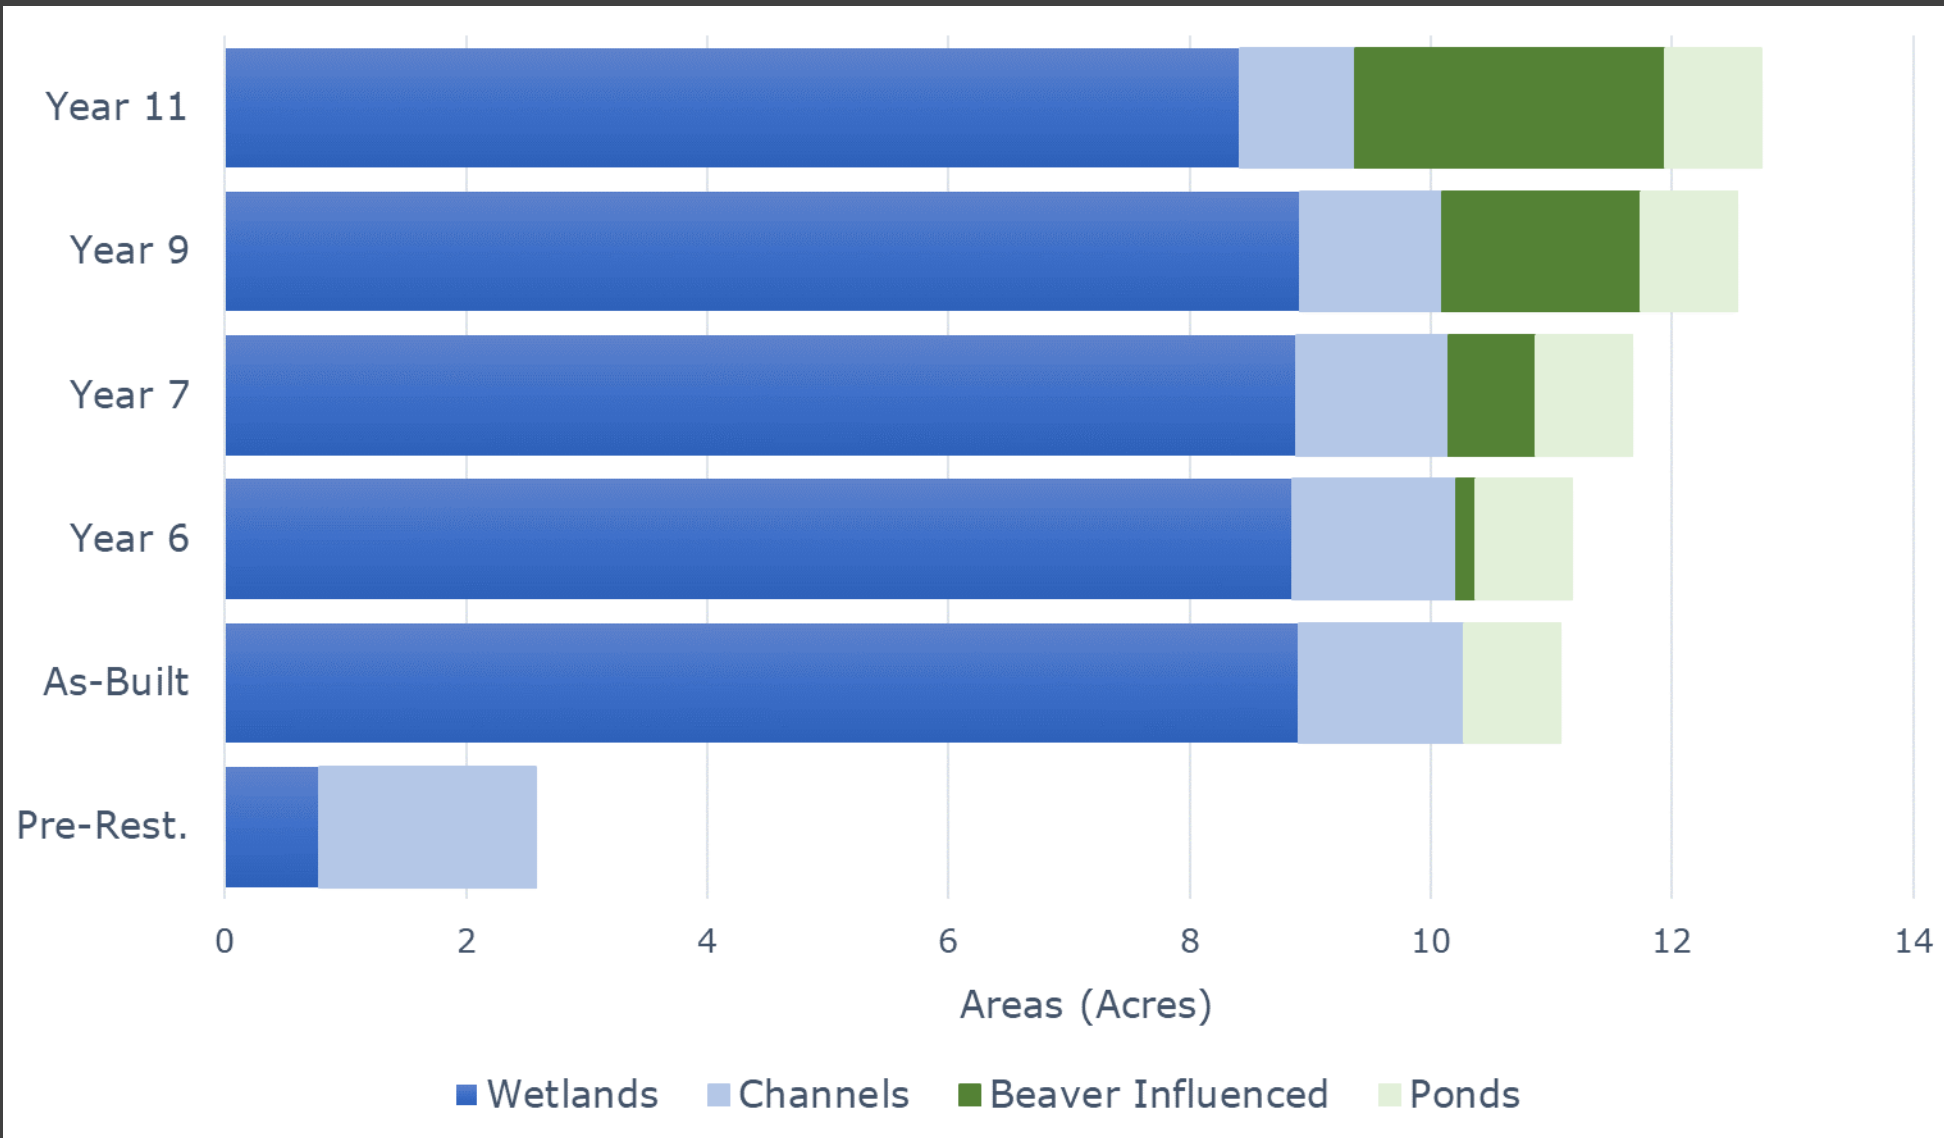

*As-built Restoration Condition*

*Year 11 (2023)*

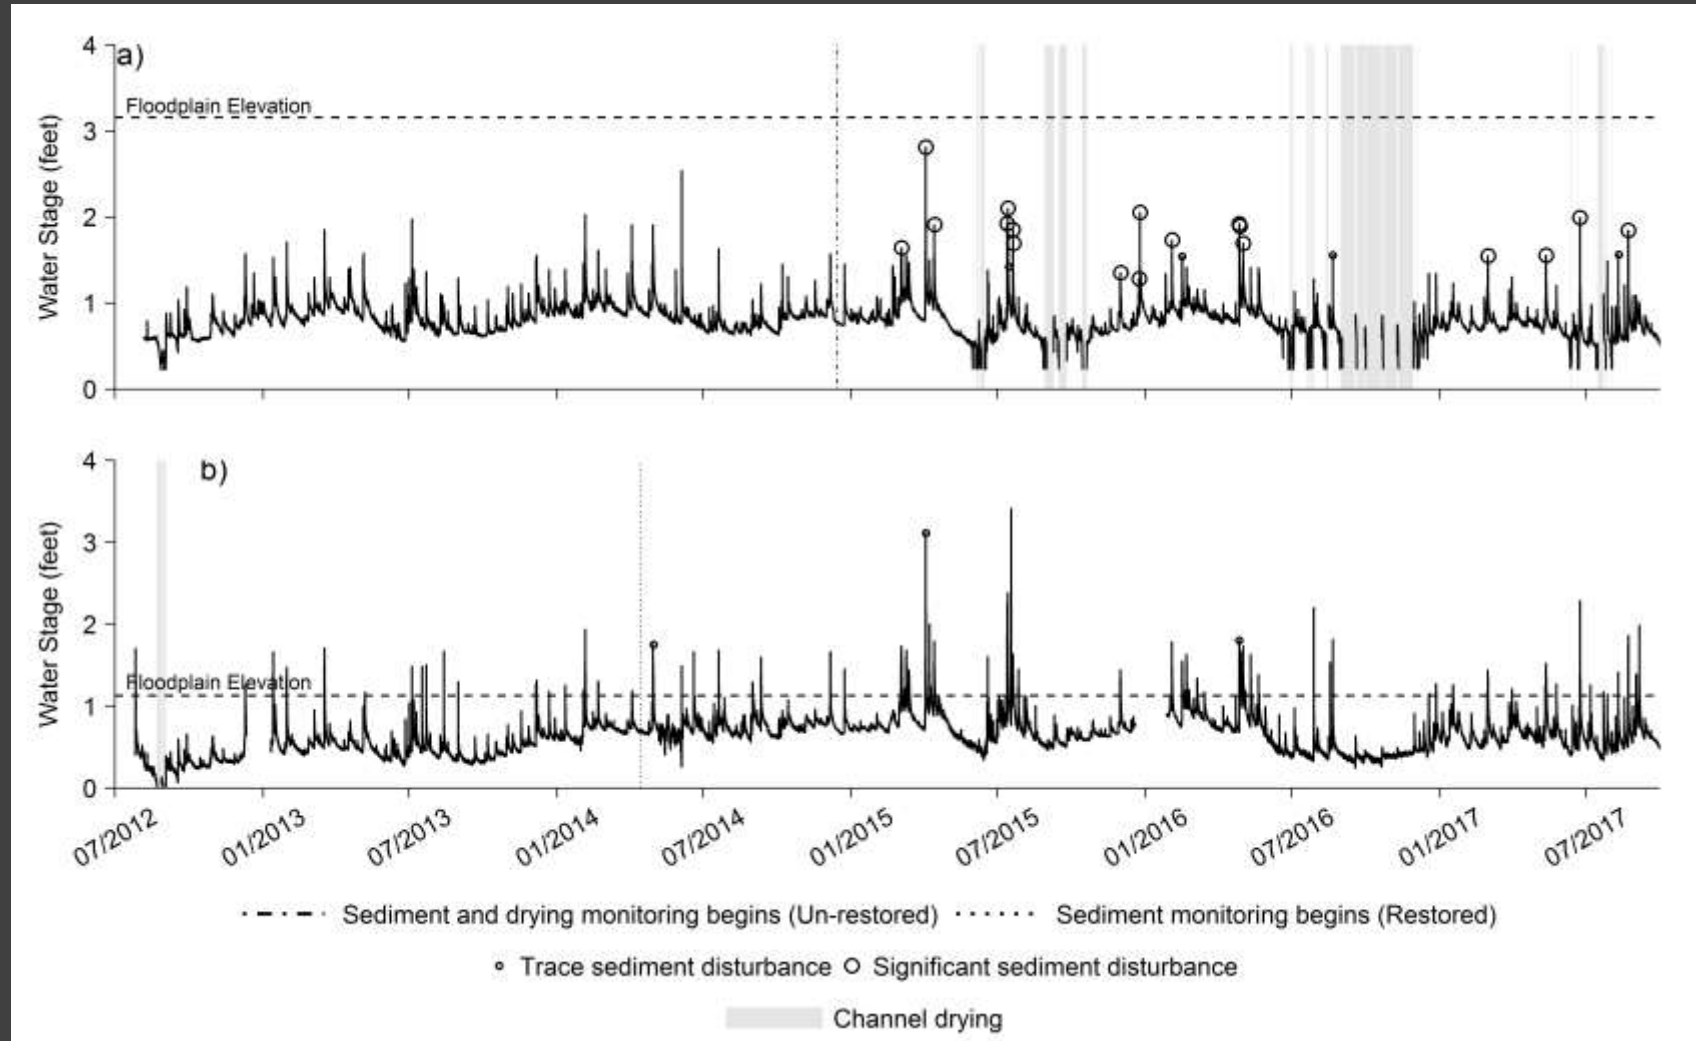

*Preliminary habitat analysis.*

# Restoration of the Valley: Results

- Simple measurements are effective at showing function
- Metrics targeted: floodplain inundation frequency, frequency of drying, habitat suitability, presence of wetland vegetation, and retention of sediment/organic matter

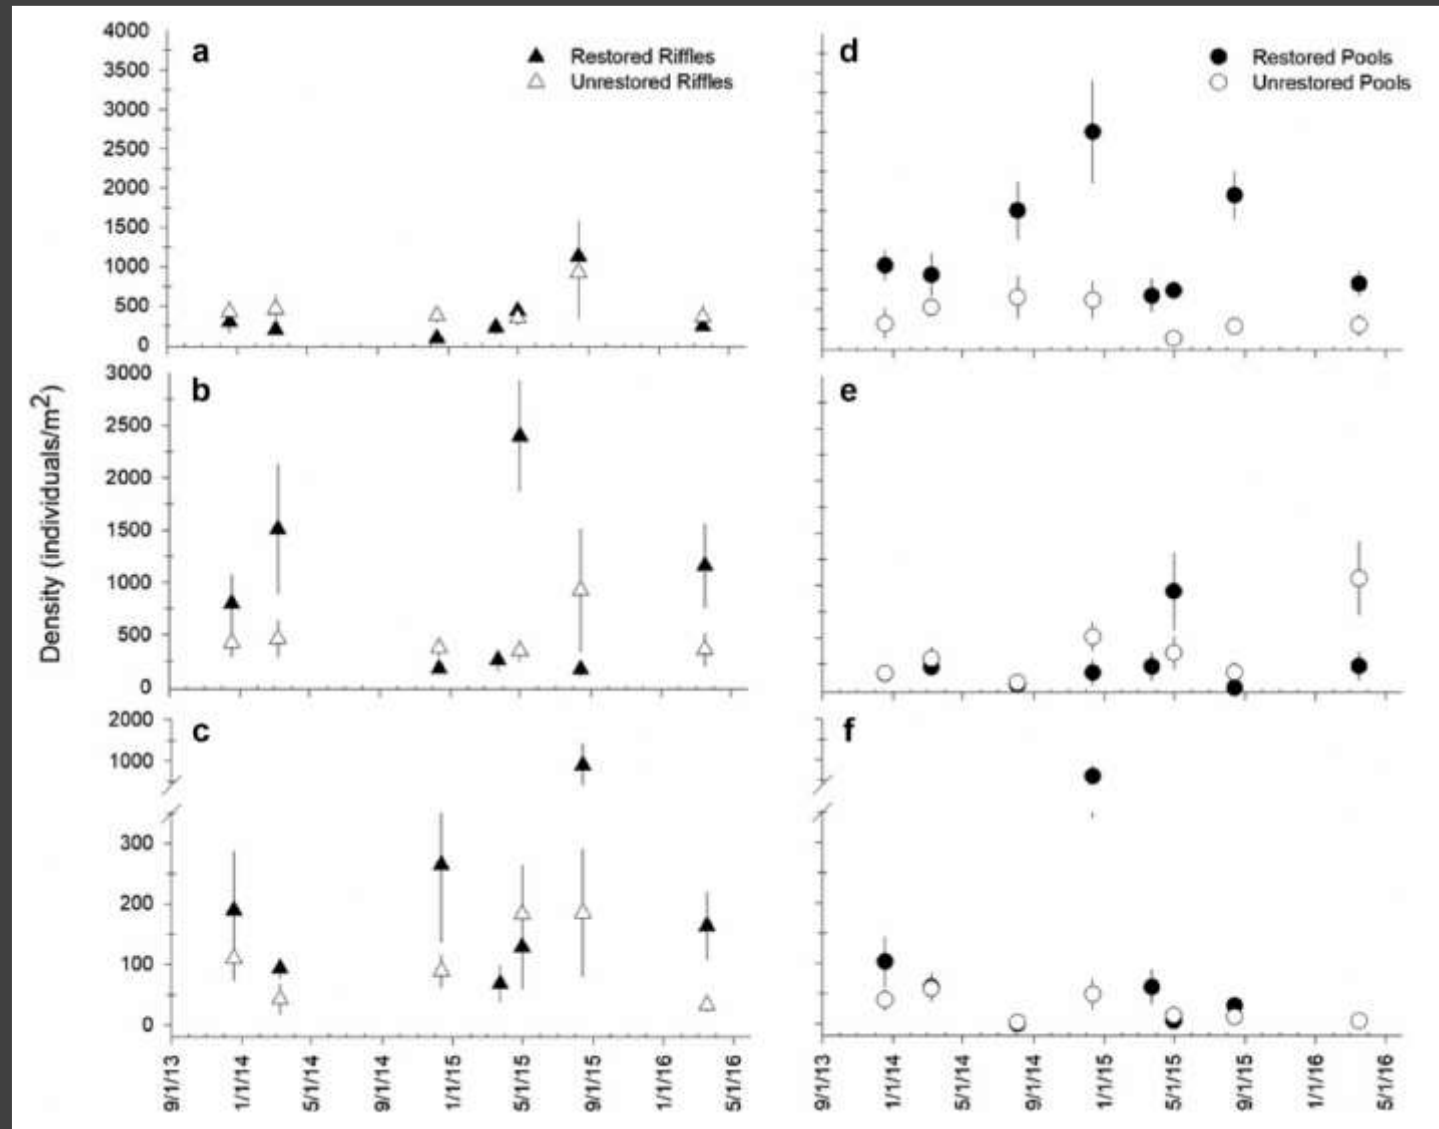

*Braccia et al., 2023 (Environ. Monit. Assess. 195:394)*

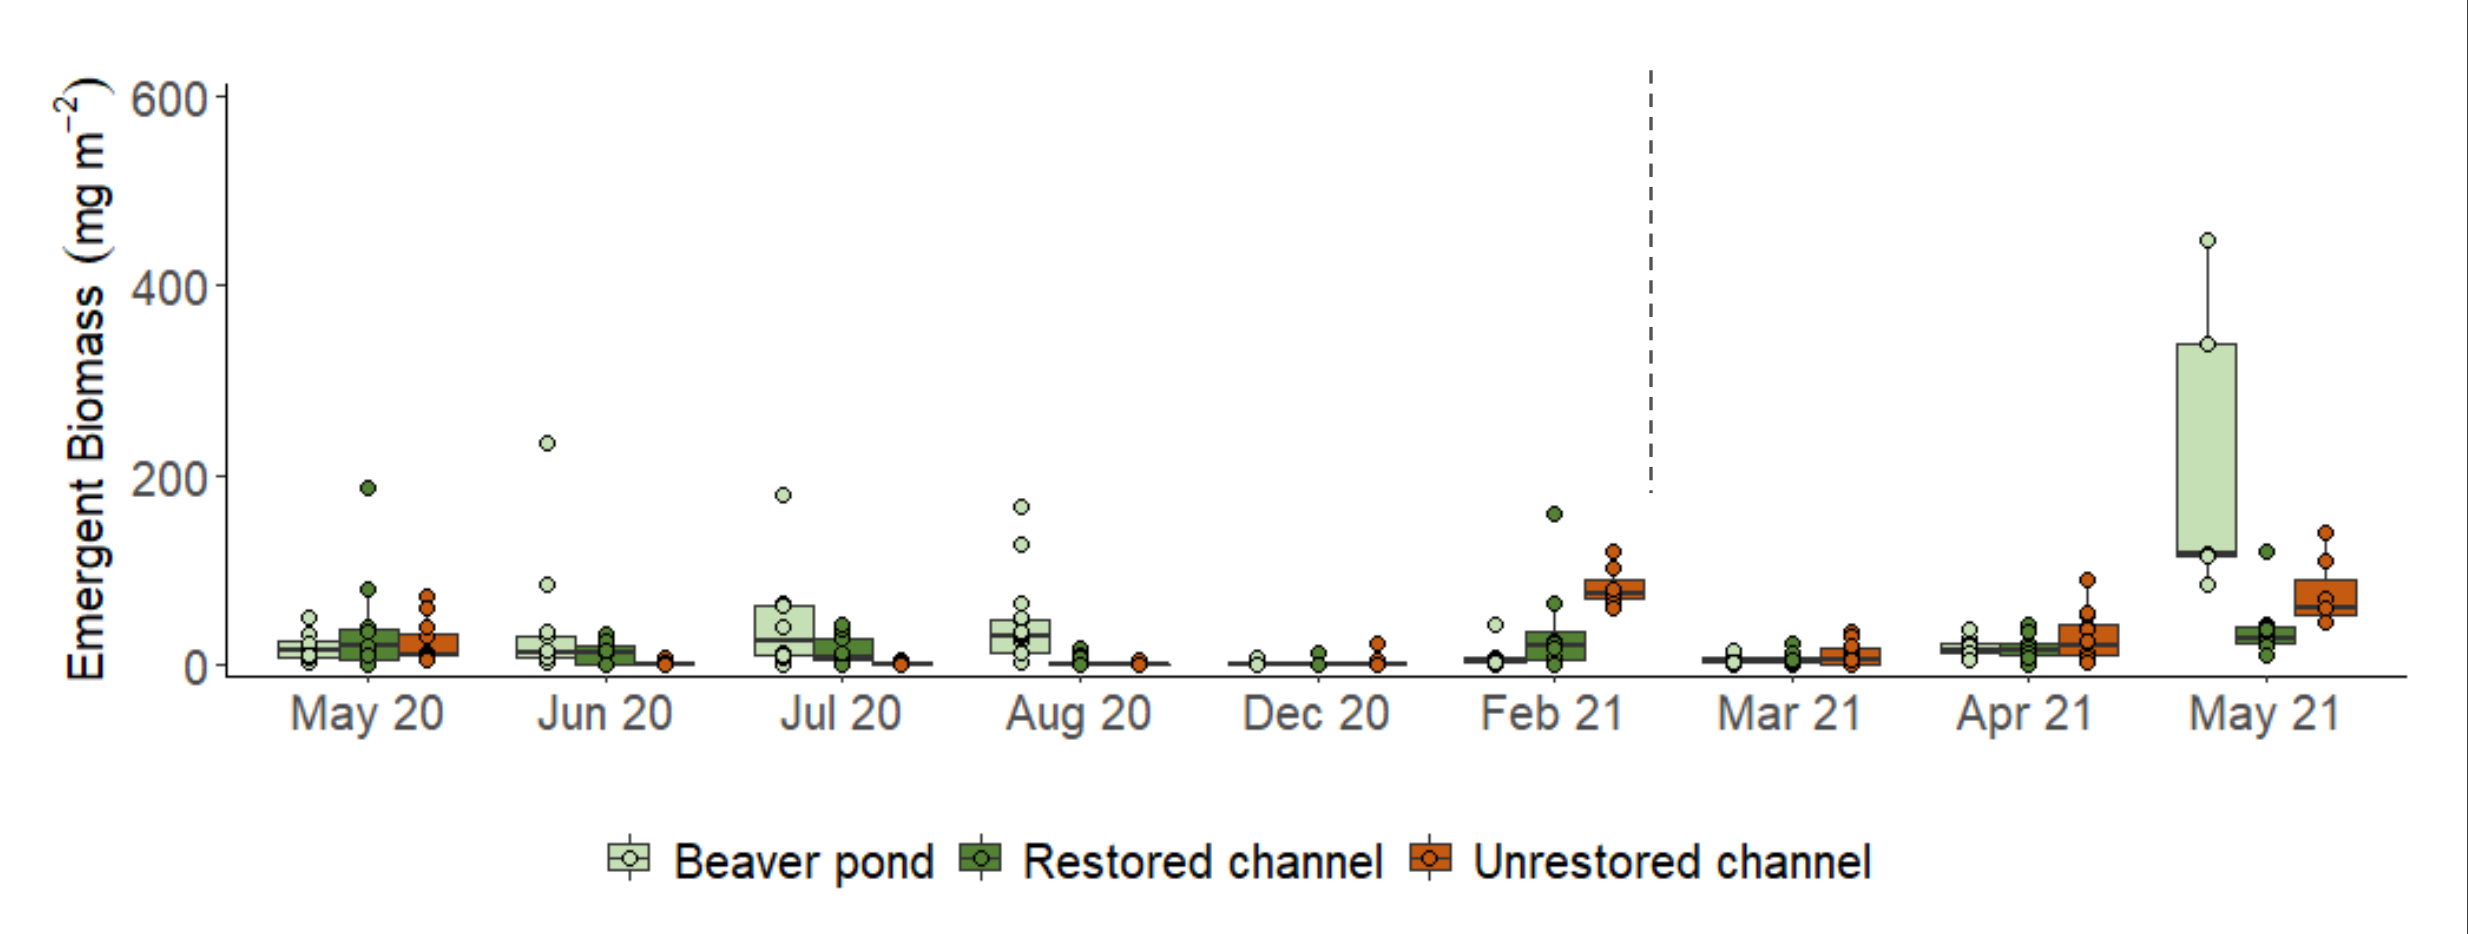

# Ecological Response: Invertebrates

- EPT Biomass 3-4X greater on in the restored channel pools
- Life histories of species in restoration in line with observed change to perennial flow
- Effective utilization of organic matter hotspots by species (burrowing mayflies)

Braccia et al., 2023 (*Environ. Monit. Assess.* 195:394)

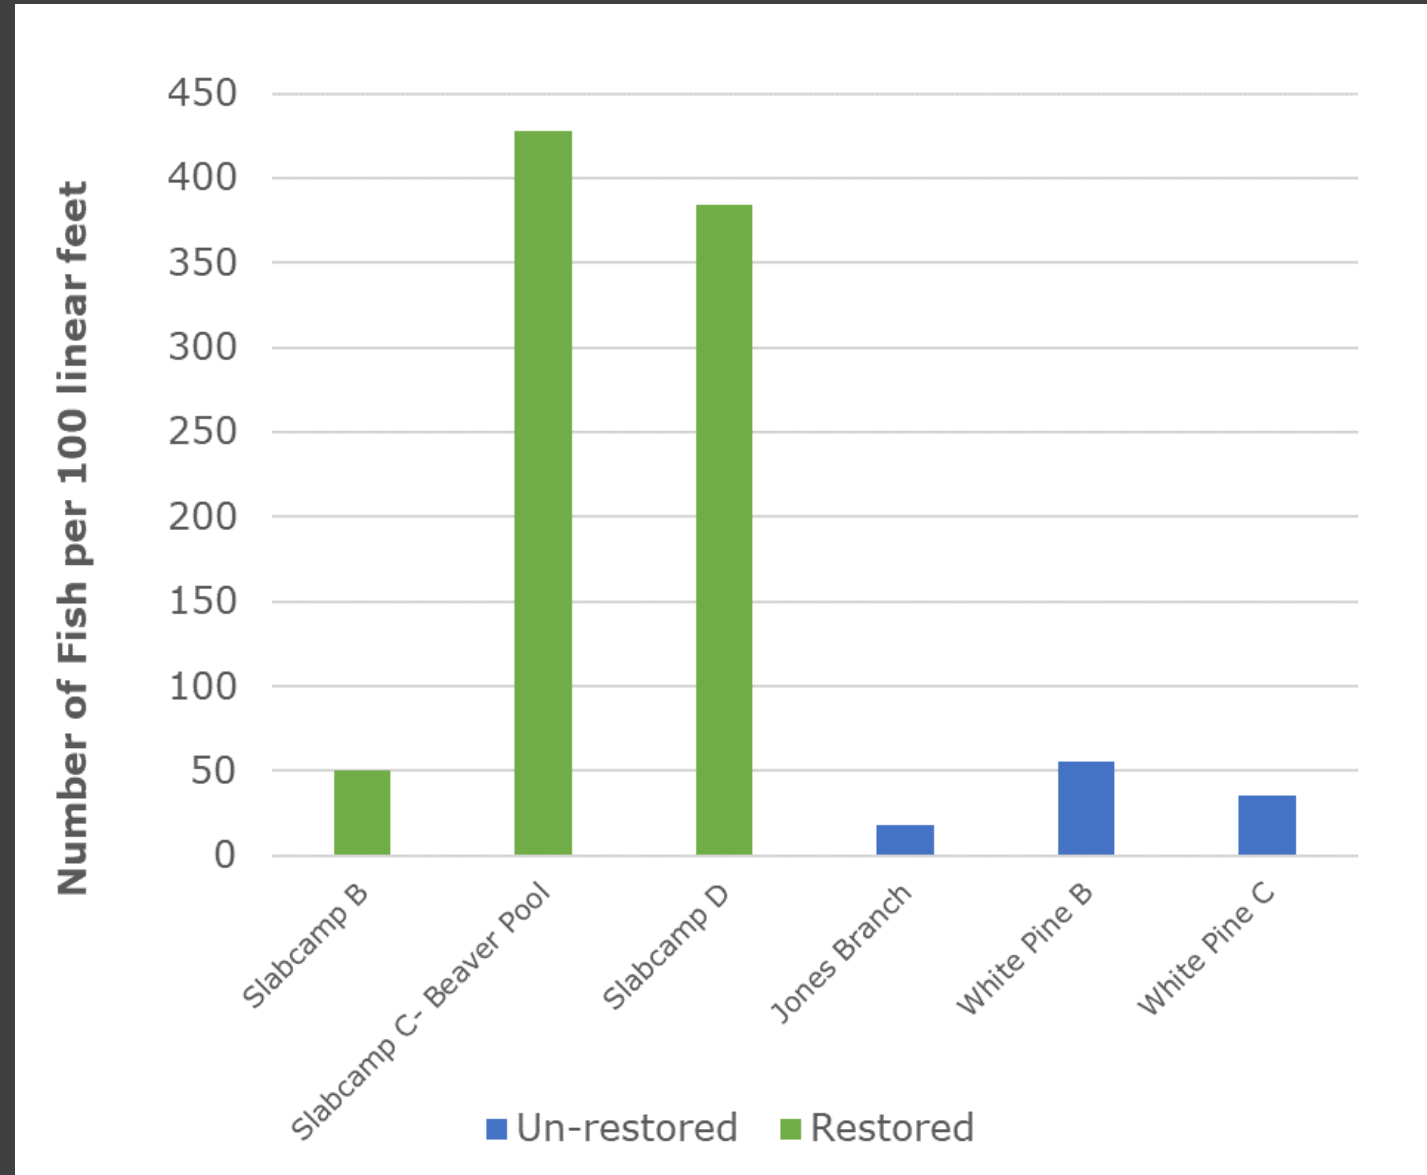

# Ecological Response: Invertebrates

Restored environments (especially beaver pools) provide food to terrestrial organisms throughout the growing season

# Ecological Response: Fish

- 9 species found in the restoration vs. 4 in the un-restored sites
- Fish in the restoration were 50-100% larger by mass

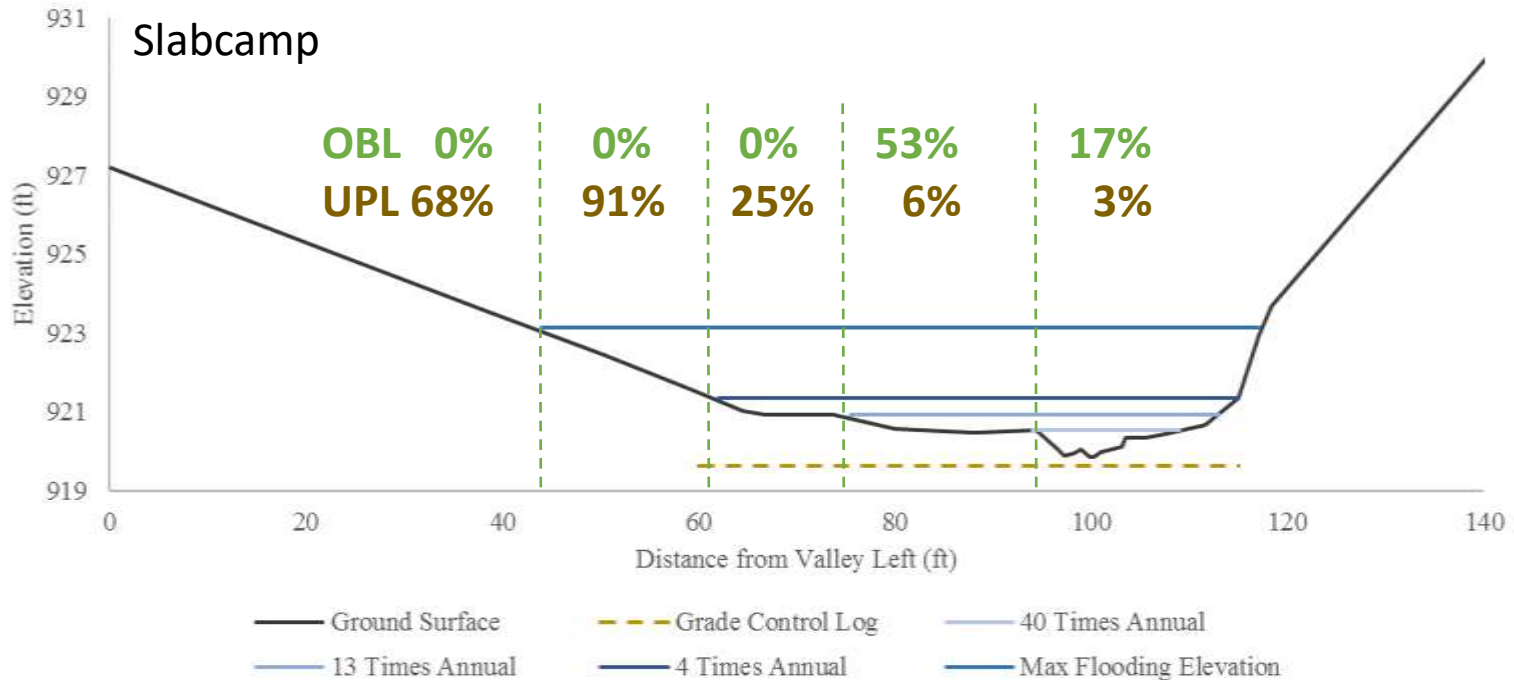

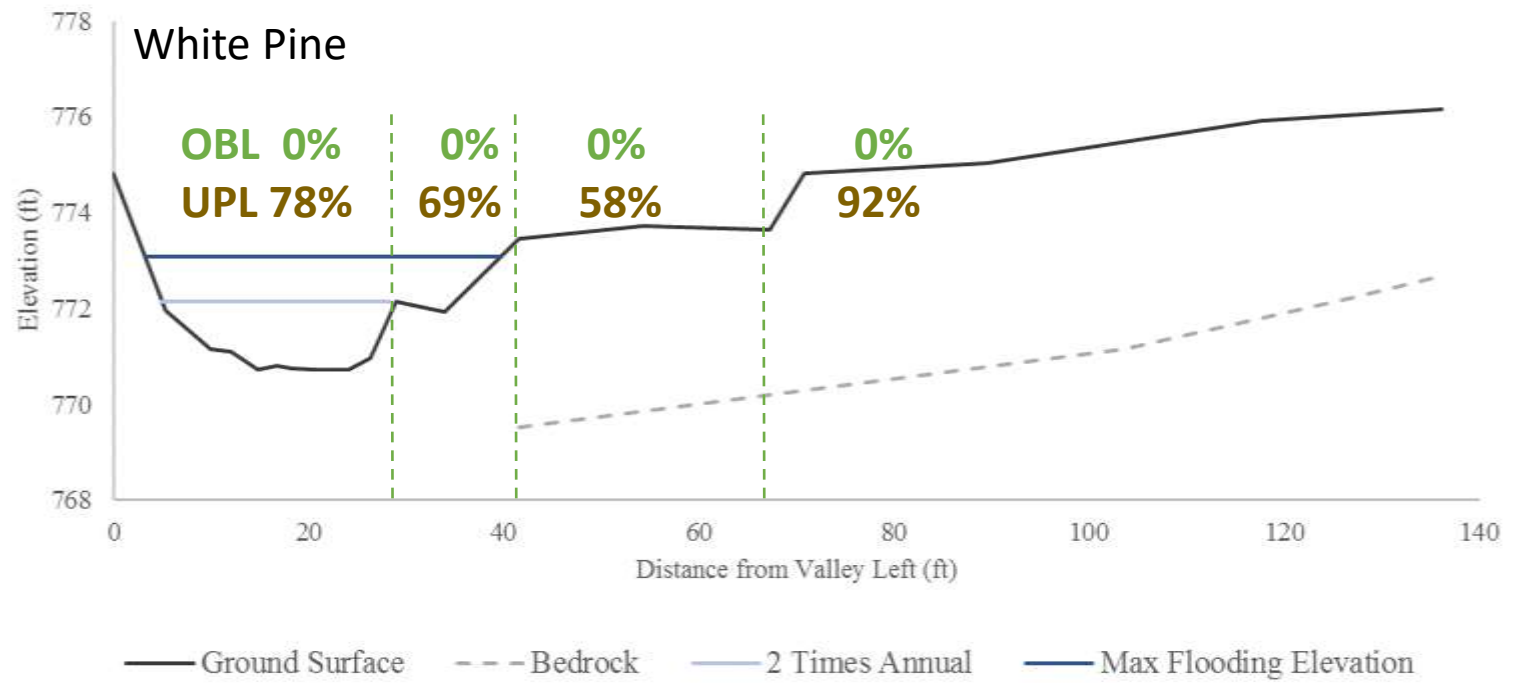

*White Pine (Un-restored)*

# Ecological Response: Vegetation

All plants (% cover)

# Conclusions

- Simple and robust measures should be sufficient if the restoration has achieved its goals
- Different outcomes / end points should be acceptable provided that the environment is functioning effectively
- Conduct pre and post restoration mapping of resources and their utilization throughout valleys
